I've created both a navigation bar and sitemap for my site. I really thought about my design and how I wanted it to look as I was creating these documents. I'm going with a more simplistic and organized look.

The navigation bar is pretty simple. The landing page will be the first page the viewer comes to. It will have my name, a graphic, and 5 different page options—About, Portfolio, Photography, Resume, and Contact. I believe in my actual sitemap I have 6 but I recently changed it to 5. They will all be evenly spaced. The navigation bar to go to each of the 5 pages will remain the same under my header photo on all 5 pages. I'm also including a search bar on each page in case a viewer wants to search for an area to revisit, or just search in general on my site. I hope my site will be simple to the majority of my audience; however, the search bar will be there if needed. I got my inspiration from looking at the PW alumni portfolios where I saw some things I did and didn't like. I also got some inspiration from other site's I've visited.

I believe that my site follows the CRAP principles. Everything will be aligned. My site is going to be pretty simple. There will be a good contrast with generic colors that will make it easy for viewers to read. My goal is to not have an overwhelming site and make it easily navigable. I used draw.io to create my sitemap and navigation page and saved them as a .pdf file.

My sitemap doesn't really give a lot of information/detail about what my website is going to look like, but you're able to get an idea of the things I'm going to include on each page.
